PROFESSIONAL SUMMARY

Software Development Engineer with **2.5+ years** in production at **Halodoc**, Southeast Asia's leading digital-health platform serving millions of users. Started on the web team building **Angular / TypeScript** apps, where I cut LCP on the flagship Chat-with-Doctor page from 7.0 s to under 2.5 s, then moved to backend. I now build **Java (Spring Boot, Dropwizard) microservices** and **Kafka** pipelines that ingest and reconcile high-volume financial data from partners, payment gateways and banks, where one wrong record means money is mis-settled. Strong in SQL performance (EXPLAIN-driven indexing, N+1 elimination, batched writes), production incident ownership and observability-led debugging. I build **Claude Code agentic skills** my team uses to find and fix issues end to end, including the tests and the merge request.

TECHNICAL SKILLS

Languages	Java (8 – 25, incl. JDK 25 migrations), SQL, TypeScript, JavaScript (ES6+)
Backend	Spring Boot / Spring 6 (MVC, Security + OAuth2, Data JPA, Session / Redis), Dropwizard, JAX-RS / Jersey, Hibernate / JPA, Node.js, Express.js, REST APIs, microservices, SOLID, design patterns
Data & Messaging	Apache Kafka (producers / consumers), MySQL 8, PostgreSQL, query tuning (EXPLAIN, indexing, batching), Liquibase, ETL / reconciliation pipelines; exposure: Redis, MongoDB, ElasticSearch
Frontend	Angular, RxJS, SSR, HTML5, CSS3, SCSS / SASS, Tailwind, responsive and cross-browser design
Cloud & DevOps	Docker, Kubernetes, AWS (EKS, RDS), Jenkins CI/CD, Git / GitLab / Bitbucket, Linux
Testing & Observability	JUnit, TestNG, Mockito, JaCoCo + SonarQube gates, Vitest, Karma / Jasmine, TDD, Dynatrace (DQL, distributed traces), production RCA
AI & Ways of Working	Claude Code, MCP, agentic workflows, LLM integration (OpenAI, Claude, Gemini), prompt engineering; Agile / Scrum, JIRA, Confluence, code reviews

PROFESSIONAL EXPERIENCE

Software Development Engineer, Halodoc

Bengaluru · Feb 2024 – Present

Started on web (Angular patient web app, CMS and Control Centre UI), then moved to backend: the financial-reconciliation platform (Java / Dropwizard) and the Spring backend of the Control Centre.

- **Data pipelines:** built and maintain Kafka- and REST-driven Java services that ingest pharmacy, insurance, payment-gateway and bank-transfer records, normalize them and aggregate them in scheduled cycles for daily settlement.
- **N+1 elimination across 4 reconciliation microservices:** replaced per-row lookups with batched *IN (...)* preloads and per-row updates with bulk writes, holding new code to 100% branch coverage (Mockito / TestNG) to pass the Sonar gate. Deliberately left IDENTITY-keyed inserts unbatched, since Hibernate disables JDBC batching for them and their IDs feed downstream Kafka events.
- **Latency root-causing (5 – 13 s APIs and Kafka consumers)** with EXPLAIN on production MySQL: a query scanning 2.6M rows to return ~500 because no index led with the selective column, blocking work on the Kafka poll thread, and a synchronous batch job on the request thread; shipped index, async-offload and query fixes. Rewrote an aggregation query over a ~48-day window to remove a ~12 s slow query.
- **Production outage recovery:** led recovery when a shared-library release wrote a column missing from the prod schema and failed every insurance-claim ingestion job. Traced it to a deploy-before-DDL ordering gap, caught a second missing column, verified the schema across all affected tables, confirmed the backfill and flagged sibling services at the same risk.
- **Observability:** cut a production 4xx ticket queue from **90 to 1** with a Dynatrace DQL sweep, root-causing each ticket against source code; documented two metric pitfalls that made stale errors look live.
- **Spring REST APIs (Control Centre):** built payout-disbursal, TPA payment / transfer / retry, bank-account-validation and recon watchdog-unblock endpoints secured with Spring Security RBAC and audited access; fixed proxy mappings that silently dropped settlement fields.
- **Data correctness and integrations:** audited validation flows across 6 reconciliation verticals and fixed a GET/POST JSON-key mismatch that wiped settlement data and enum drift that silently rewrote claim and refund statuses. Traced payment-gateway charge rejections to a null card-BIN field and 35 – 45 s login P99 spikes to a synchronous third-party call.
- **Frontend performance:** cut LCP on halodoc.com/tanya-dokter, the flagship Chat-with-Doctor page, from **7.0 s to under 2.5 s** using Angular SSR TransferState, Renderer2 preload injection and a custom eager-first image grid, root-caused by auditing compiled bundles without library source.
- **Product UI:** built responsive Angular / TypeScript features for Tanya Dokter consult flows, CMS, and Coupons / Promo tooling (Angular + Node BFF) that let ops teams run content and campaigns without engineering help.
- **AI-assisted engineering:** built Claude Code agentic skills used by the team: an N+1 analyzer that builds a prioritized fix tracker, a migrator that implements the fixes with tests and opens the MR, a Dynatrace auto-heal triage skill gated on tests, and a lint-fix agent with ESLint tooling.

EDUCATION

B.Tech, Information Science Engineering, National Institute of Engineering (NIE), Mysuru — 2020 – 2024

PUC, Sri Chaitanya Jr Kalashaala (91.3%) · CBSE 10th, JNV Dharwad (88%)
